Full stack web development using python match

Saurabh Shukla (MySirG)

Agenda

match subject_expression:

case constant:

case constant:

case constant:

case constant:

break keyword cannot be wed in match block

Example oc=int (input ("Enter a number")) match x:

case 1: print ("One")

core 2: print ("two")

case 3: print ("Three")

case 4:
print ("Forur")

case constant can be of any type. oc = evol (input ("Enter a number")) match x: case I.I: print ("One") case "two". print ("two") case True: print ("Three") case 3+4j: print ("Four")

```
default matching
oc=int (input ("Enter a number"))
match x:
    case 1:
print ("One")
    core 2:
print ("two")
     case 3:
print ("Three")
     case 4:
print ("Four")
     case _:
print ("default")
```

motch

- match and case are soft keywords
- . They are not reserved werds in other grammatical contexts
- They are recognized as keywords when part of a match statement or case block only, and are allowed to be used in all other contexts as variables or argument names.

duplicate care

duplicate care is not an error but first match will only work.
